

AI-Pass QA Test Plan

Project: AI-Pass - Enterprise AI Operating System Demo

Prepared by: Oleg Gogol

1. Objective

Validate the AI-Pass demo application from the perspective of an enterprise user. The testing process covers authentication, dashboard visibility, marketplace discovery, AI application data rendering, task form behavior, responsive design, API behavior, and error handling.

2. Scope

In scope: login/logout, dashboard widgets, navigation, marketplace search and category filtering, application details and install CTA, AI Apps page, Simple Task form, REST API endpoints, basic responsive checks, and core error messages. Out of scope: real payment flows, production integrations, advanced AI model execution, enterprise identity providers, and security penetration testing.

3. Test Strategy

The strategy combines manual exploratory testing and automated regression testing. Manual testing verifies usability, wording, responsive design, visual consistency and edge cases. Automation uses Playwright with Page Object Model and reusable fixtures to cover stable smoke and regression scenarios. REST API tests verify successful and negative paths using Playwright request context.

4. Test Environment

Application: AI-Pass demo app. Browsers: Chromium and Firefox. Devices: desktop viewport 1280x720; mobile responsive checks planned manually. Test data: demo@aipass.test / Pass123!. API auth token: demo-token.

5. Entry Criteria

The application is deployed and reachable through a public URL; demo credentials are available; core pages are accessible; no blocking infrastructure outage prevents test execution.

6. Exit Criteria

Critical paths pass: valid login, dashboard loading, navigation, marketplace search/filter, AI Apps page rendering, task creation, API auth/error handling. All discovered issues are documented with severity and priority.

7. Test Scenarios

Feature	Scenario	Expected Result
Authentication	Valid login with demo credentials	User enters workspace/dashboard
Authentication	Invalid credentials	Error message displayed; user remains logged out
Authentication	Empty fields	Required-fields validation displayed
Dashboard	Dashboard loads after login	Widgets are visible and data is rendered
Navigation	Open Marketplace, AI Apps and Simple Task pages	Correct page title and content displayed
Marketplace	Search by app name/description	Filtered results are shown
Marketplace	Filter by category	Only selected category apps are displayed
Marketplace	Open app details	Details panel and Install button are visible
AI Apps	Open an AI app	App detail renders expected data

Feature	Scenario	Expected Result
Forms	Create task with valid data	Success message displayed
Forms	Submit task with empty title	Validation message displayed
API	GET /api/apps	200 and list of apps returned
API	GET /api/dashboard without token	401 error returned
API	POST /api/tasks with invalid payload	400 validation error returned

8. Test Cases

ID	Title	Steps	Expected
TC-01	Valid login	Open app; enter demo email/password; click Login	Dashboard is displayed
TC-02	Invalid login	Open app; enter invalid credentials; click Login	Invalid credentials error displayed
TC-03	Empty login fields	Open app; click Login without entering data	Required-fields error displayed
TC-04	Dashboard widgets	Login and observe dashboard	Three widgets are visible
TC-05	Marketplace search	Open Marketplace; search for Invoice	Only Invoice AI is displayed
TC-06	Marketplace filter	Select Finance category	Only Finance apps are displayed
TC-07	App details	Click first marketplace card	Details section and Install button visible
TC-08	AI App data	Open AI Apps; open first app	Detail section renders category data
TC-09	Task creation	Open Simple Task; fill title/description; submit	Success message displayed
TC-10	API invalid task	POST /api/tasks with missing title	400 error with validation message

9. Test Execution Summary

Area	Manual Status	Automated Status	Notes
Authentication	Pass	Automated	Core valid/invalid/empty paths covered
Dashboard	Pass	Automated	Widgets and navigation covered
Marketplace	Issue found	Automated	Known issue: count label does not update after filtering
AI Apps	Pass	Automated	Basic data rendering covered
Tasks	Pass	Automated	Positive and empty-title validation covered
API	Pass	Automated	Positive and negative API paths covered
Responsive design	Pass with observations	Manual	Mobile layout stacks content vertically

10. Risks and Limitations

The demo application is intentionally small and uses mock data. Authentication is simplified and does not include MFA, session expiry or role-based permissions. API coverage is limited to demonstration endpoints. Future improvements should include cross-browser matrix expansion, accessibility checks, visual regression and performance smoke tests.
